

# Remote Visualization at JSC (with ParaView)

Jülich Supercomputing Centre, Forschungszentrum Jülich GmbH, Germany  
Algorithms, Tools & Methods Lab Visualization

Herwig Zilken, 2022/11/24

# Visualization at JSC

## Algorithms, Tools & Methods Lab Visualization

- **Scientific Visualization**
  - R&D + support  
for visualization of scientific data
- **Virtual/Augmented Reality**
  - VR visualization based on Unreal Engine, with head mounted displays and tablet computers  
for data analysis and presentation
- **Multimedia**
  - multimedia productions  
for websites (e.g. Youtube), presentations or on TV

# Visualization at JSC

## JUWELS: closer look at login nodes

### Cluster

#### 4 x Login Nodes with GPU

- juwelsvis00 to juwelsvis03
- (juwelsvis.fz-juelich.de)
- 768 GB RAM each
- 1 GPUs Nvidia Pascal P100 per node
- 12 GB RAM on GPU

#### 9 x Login Nodes without GPU

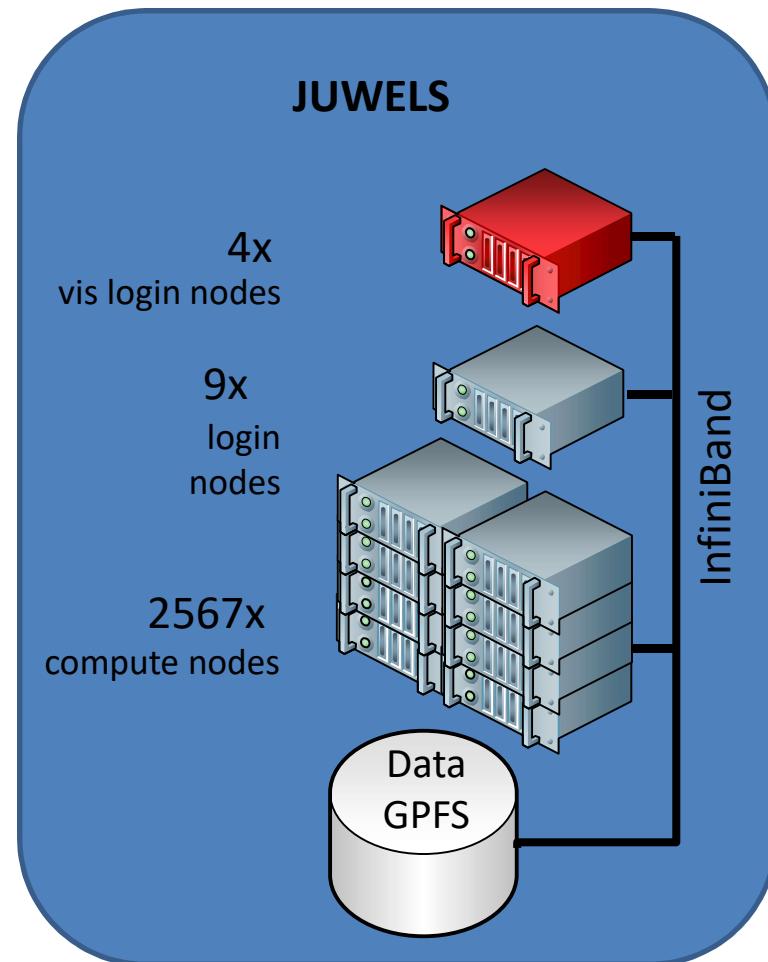

- juwels-cluster

### Booster:

#### 4 x Login Nodes without GPU

- juwels-booster
- no Xserver, no GPU → limited usage for visualization

**Keep in mind:** software rendering is possible on any node

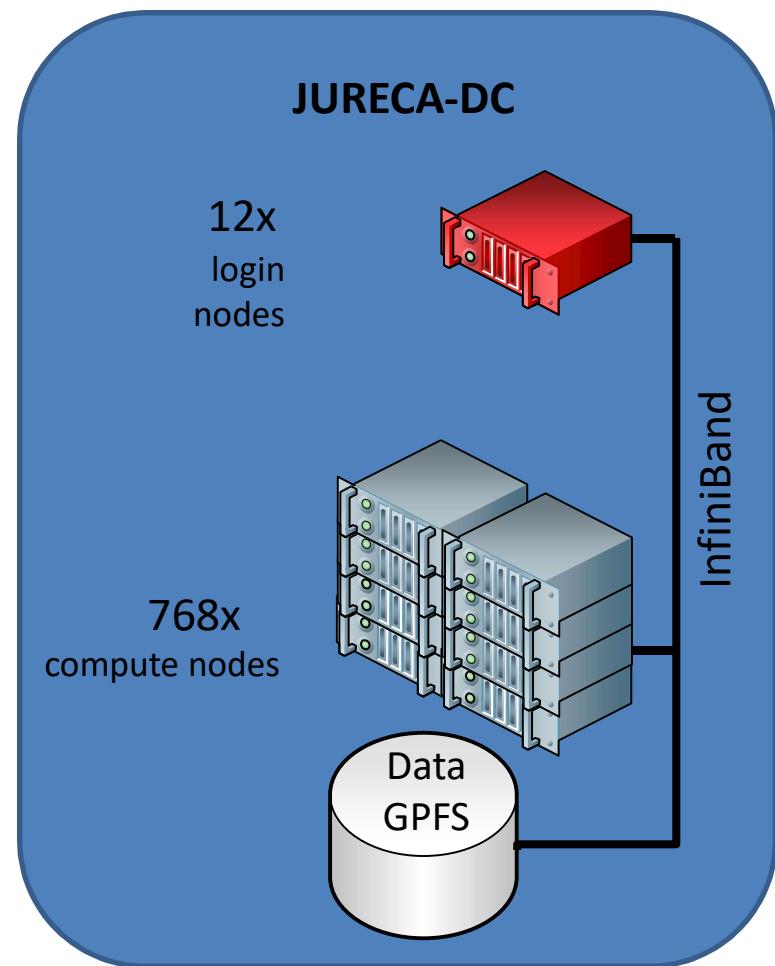

# Visualization at JSC

## JURECA-DC: closer look at login nodes

### 12 x Login Nodes with GPU

- jureca01 to jureca12
- (jureca.fz-juelich.de)
- 1024 GB RAM each
  
- 2 x Nvidia Quadro RTX8000 per node
- 48 GB RAM on each GPU

**Keep in mind:** software rendering is possible on any node

# Visualization at JSC

## General Software Setup

### Typical Software Stack for Visualization

Base Software:

X-Server, X-Client (Window-Manager)

OpenGL (libGL.so, libGLU.so, libglx.so), Nvidia or Mesa driver

Middleware:

Xpra

Virtual Network Computing: VNC-Server, VNC-Client

VirtualGL (for remote hardware rendering, if possible)

Parallel and Remote Rendering App, In-Situ Visualization:

ParaView

VisIt

Other Visualization Packages (more packages on user demand):

Blender, GPicView, VTK, VMD

# Remote 3D Visualization

at Jülich Supercomputing Centre

- X forwarding + Indirect Rendering  
**slow, maybe incompatible → bad idea**
- “intrinsic remote capable” visualization apps  
**application dependent error-prone setup**
- Xpra - stream application content with H.264 + VirtualGL  
**easy setup, our recommendation → good idea**
- Also VNC + VirtualGL can be used
  - Not discussed today
  - Documentation provided on slides

# Remote 3D Visualization

## with X Forwarding + Indirect Rendering

Traditional Approach (X forwarding + Indirect Rendering)

`ssh -X <USERID>@<SERVER>`

- uses GLX extension to X Window System
- X display runs on user workstation
- OpenGL command are encapsulated inside X11 protocol stream
- OpenGL commands are executed on user workstation
- **disadvantages**
  - User's workstation requires a running **X server**.
  - User's workstation requires a **graphic card** capable of the required OpenGL.
  - User's workstation defines the **quality and speed** of the visualization.
  - User's workstation requires **all data needed** to visualize the 3d scene.
  - This approach is known to be error prone (OpenGL version mismatch, ...)

Try to **AVOID** for 3D visualization.

# Remote 3D Visualization

## with Xpra + VirtualGL

- X-applications forwarded by Xpra (or VNC) appear on the local desktop as normal windows
- allows disconnection and reconnection without disrupting the forwarded application
- **advantages**
  - **No X is required** on user's workstation (X display on server).
  - **No OpenGL is required** on user's workstation (only images are send).
  - Quality of visualization does **not depend** on user's workstation.
  - Data size send is **independent** from data of 3d scene.
  - Disconnection and reconnection possible.
- **VirtualGL** for hardware accelerated rendering: use `vglrun <application>`
  - it **intercepts the GLX** function calls from the application and **rewrites them**.
  - The corresponding GLX commands are then sent to the X display of **the 3d X server**, which has a 3D hardware accelerator attached.
- Good solution for any OpenGL application

<https://xpra.org/>

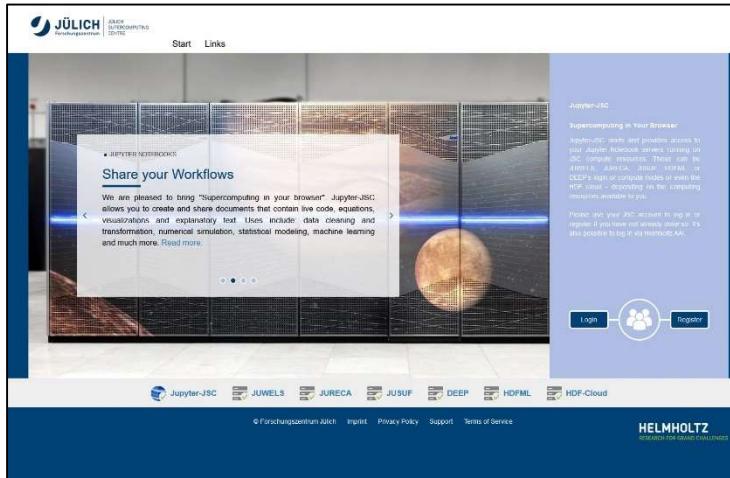

# How to use Xpra @ JSC

How to start an Xpra session:

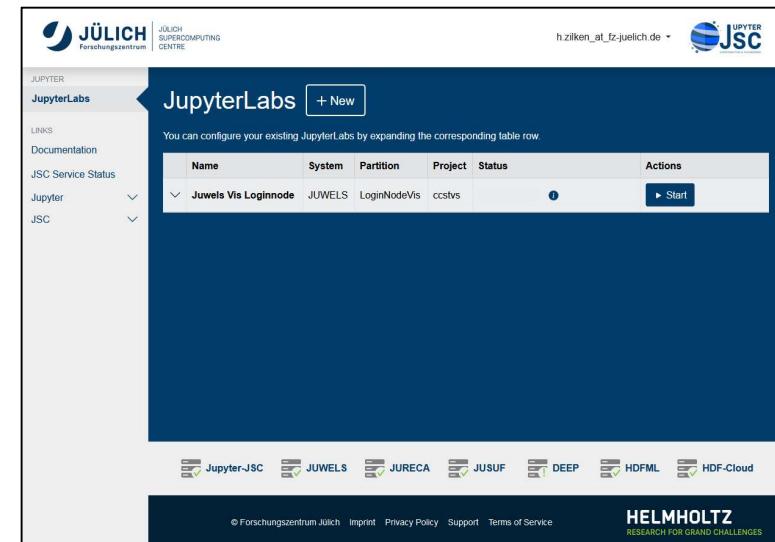

- **From JupyterLab@JSC**  
<https://jupyter-jsc.fz-juelich.de>
  - See next slides
  - Very easy setup, no additional software needed (only browser)
  - Can be a little bit slow sometimes
- Alternative: start Xpra session manually
  - Can be a little bit faster than Xpra in browser
  - Xpra client needs to be installed on your local machine
  - Need to start Xpra on HPC system and locally by hand
  - Just in case you need it: documentation provided on later slides

# Xpra Integration in JupyterLab@JSC

1. Go to <https://jupyter-jsc.fz-juelich.de> and login

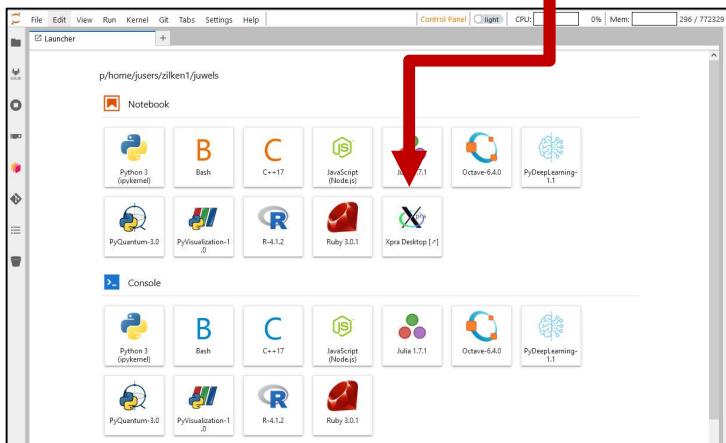

2. Add a new or start an existing JupyterLab on JURECA login node or JUWELS vis login node.

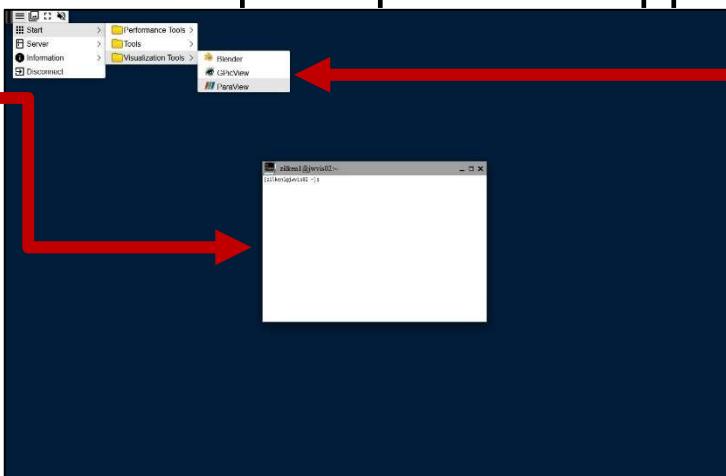

Name	System	Partition	Project	Status	Actions
Juweis Vis Loginnode	JUWELS	LoginNodeVis	ccsvs	Up	<button>Start</button>

# Xpra Integration in JupyterLab@JSC

3. If needed, start a new launcher by menu: File → New Launcher.  
In the launcher: click on the Xpra icon

4. Wait for the HTML desktop of Xpra. Start apps from the menu or from the Xterm.

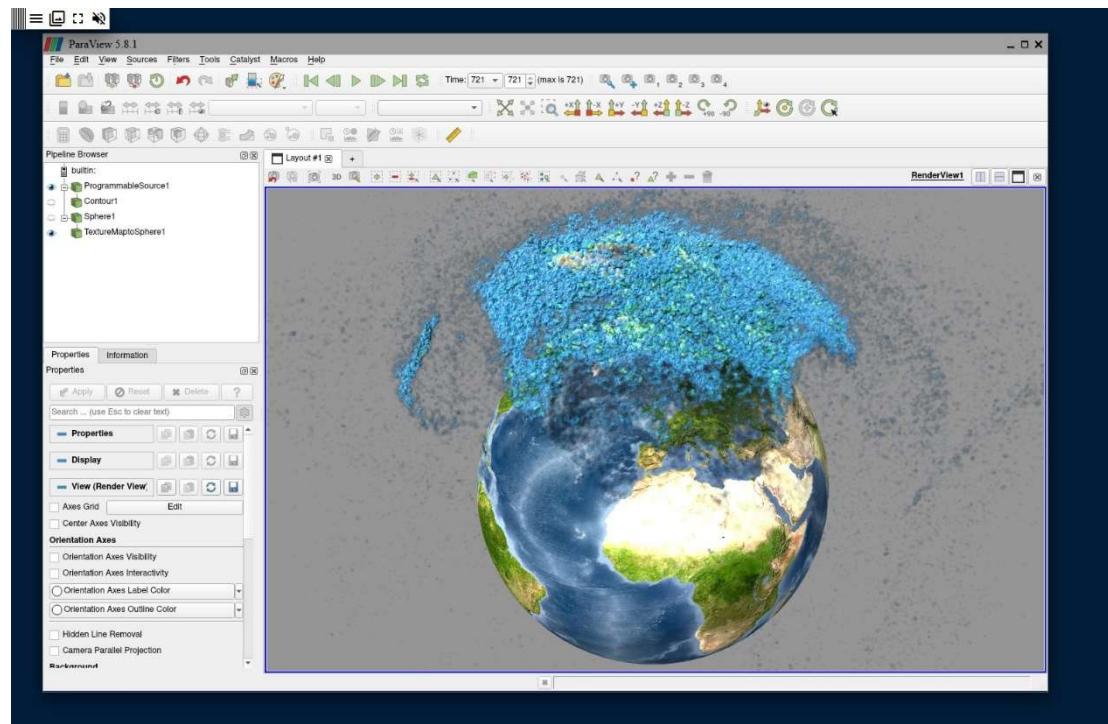

# Xpra Integration in JupyterLab@JSC

5. Start ParaView in the Xpra environment in your browser, direct access to data stored on HPC filesystem

Use Xpra Menue or load modules

ml Stages/2022 GCC/11.2.0 ParaStationMPI/5.5.0-1

ml ParaView/5.10.1

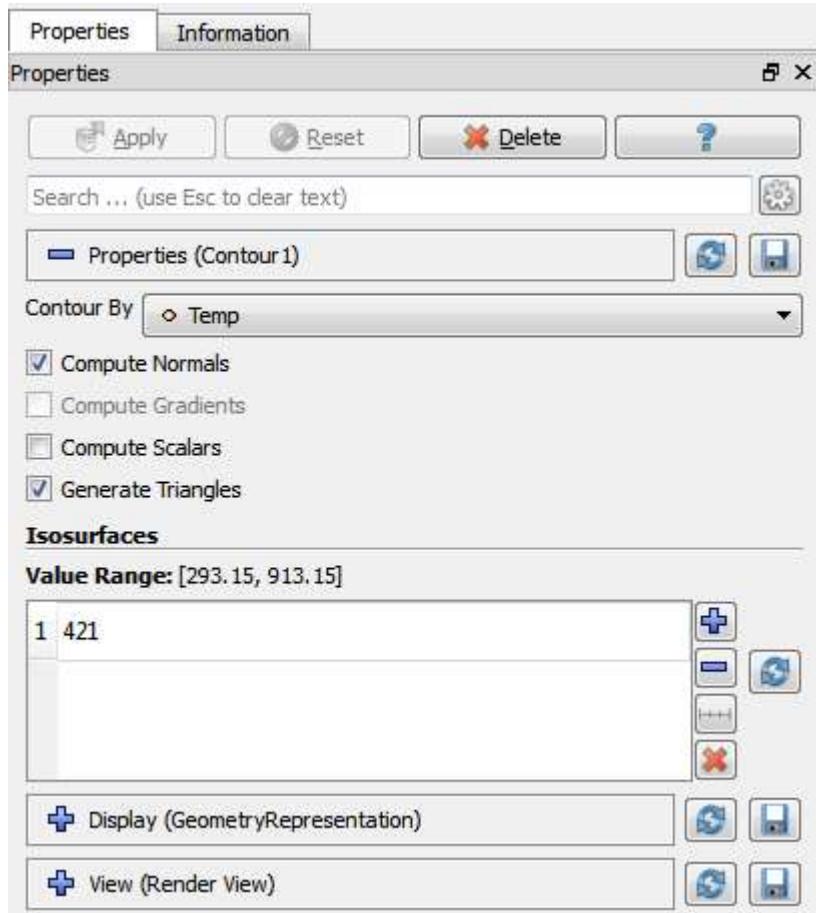

# ParaView

## for data visualization

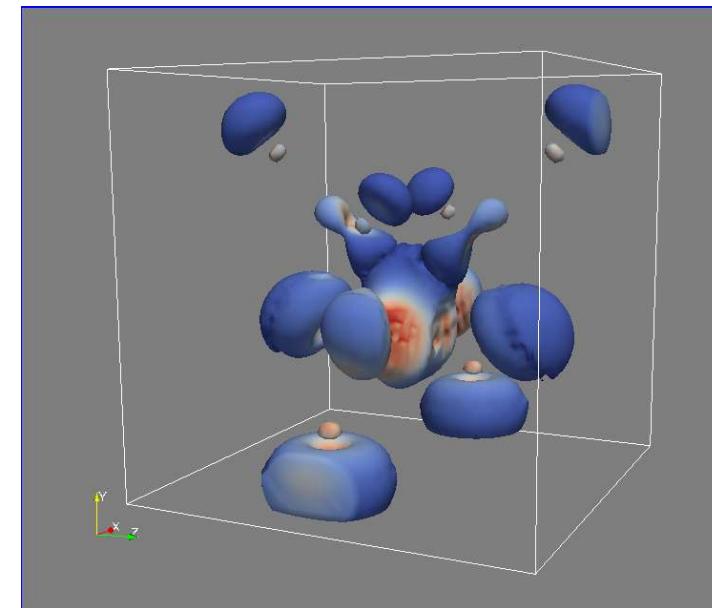

## Exercise 1

- Login to jupyter-jsc.fz-juelich.de
- Start Xpra and ParaView
- Load some data, e.g.  
`/p/scratch/share/zilken1/ParaView_HandsOn/  
headsq.vti`
- Lets have some fun with **filters**, see next slides

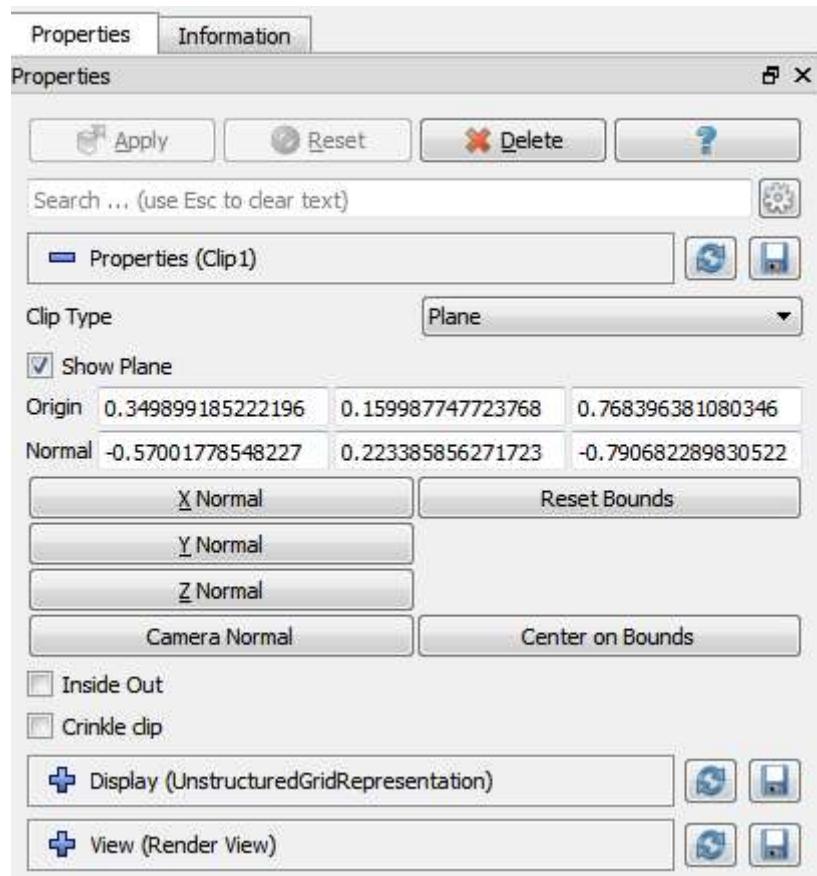

## Common Filters: Contour

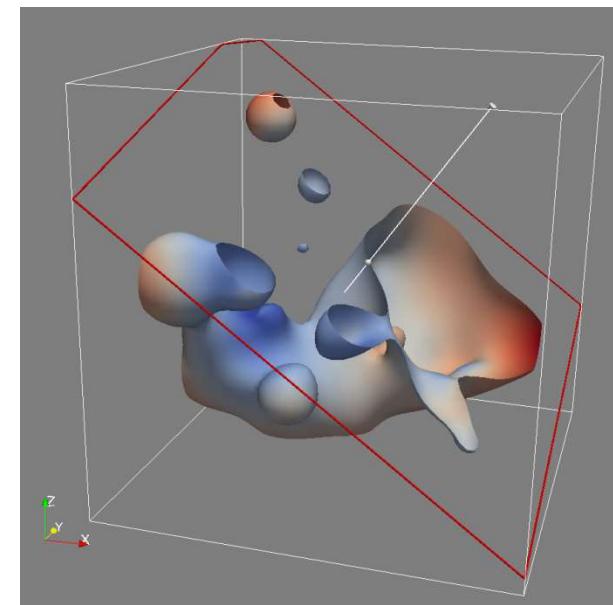

- Extracts the points, curves, or surfaces where a scalar field is equal to a user-defined value.
- This surface is often also called an isosurface

# Common Filters: Clip

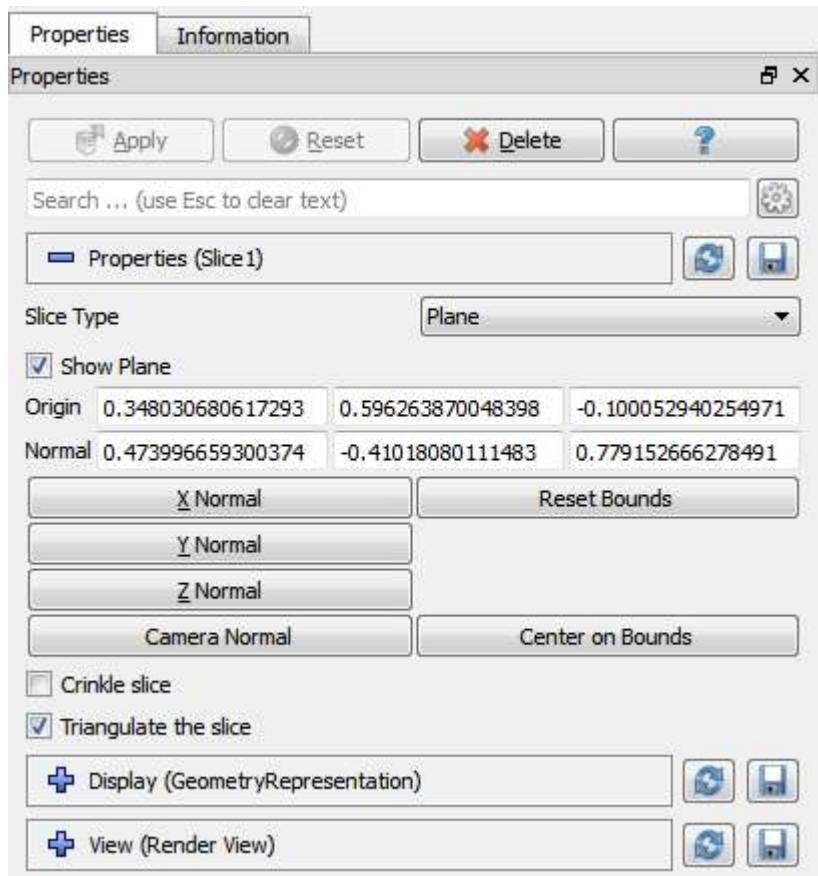

- Intersects the geometry with a user-defined plane, box or sphere
- Removes all the geometry on one side of this plane (box, sphere)

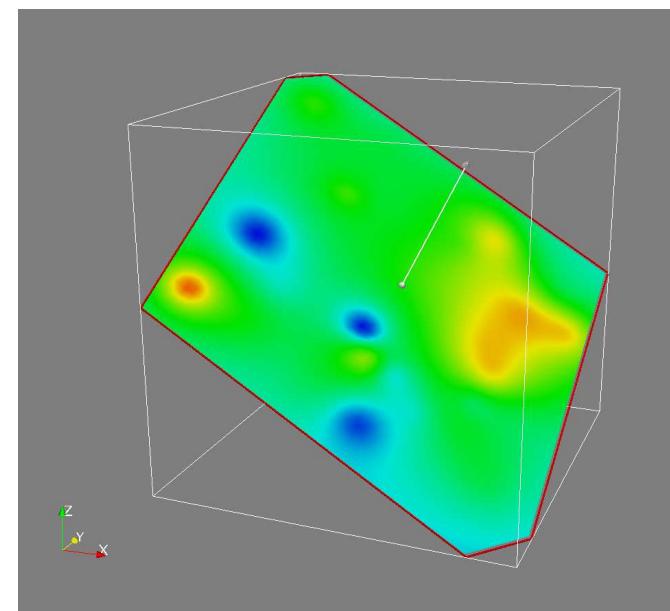

**Beware of data explosion:**  
Structured data is converted to unstructured!

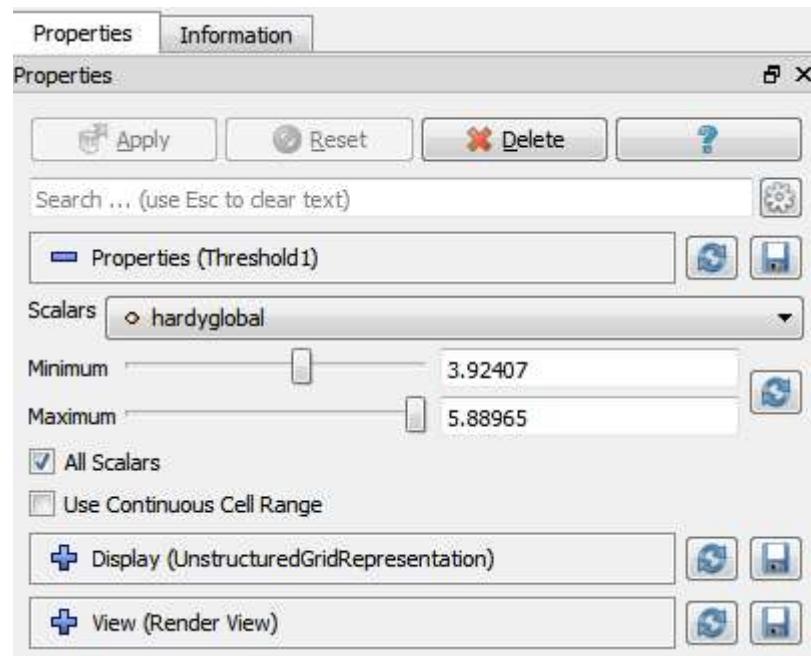

# Common Filters: Slice

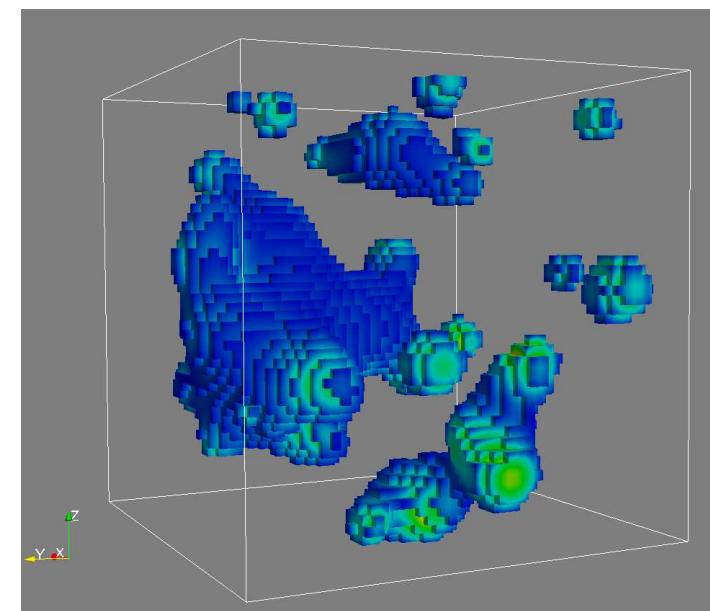

- Intersects the geometry with a plane, box, sphere or cylinder
- Similar to clipping, except that all that remains is the geometry where the plane is located.

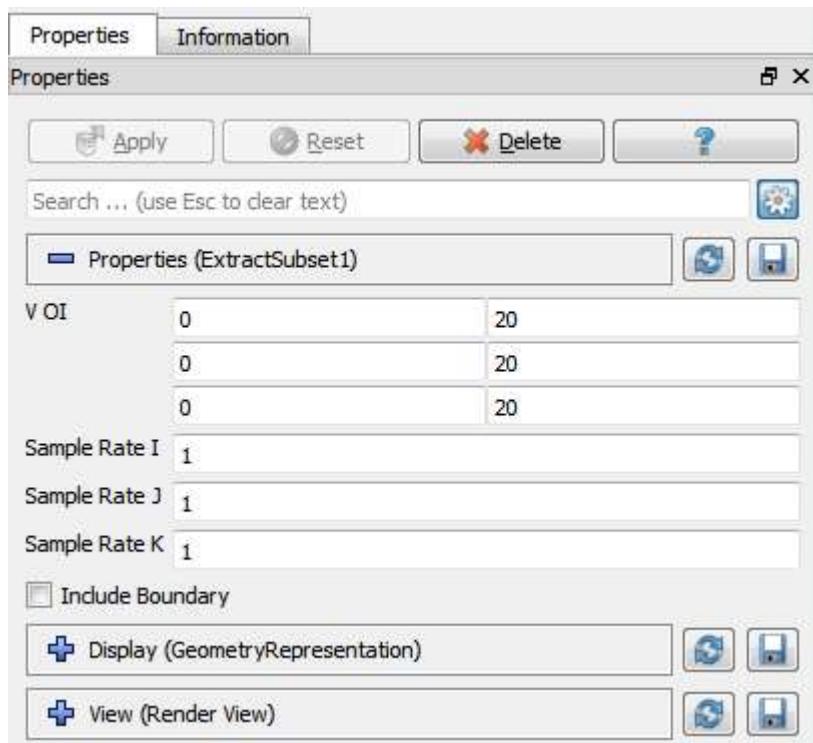

## Common Filters: Threshold

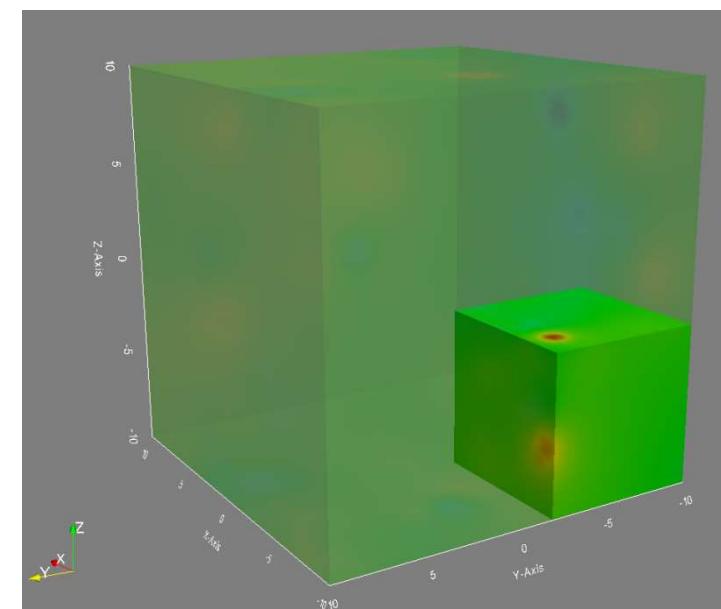

- Extracts cells that lie within a specified range of a scalar field

# Common Filters: Extract Subset

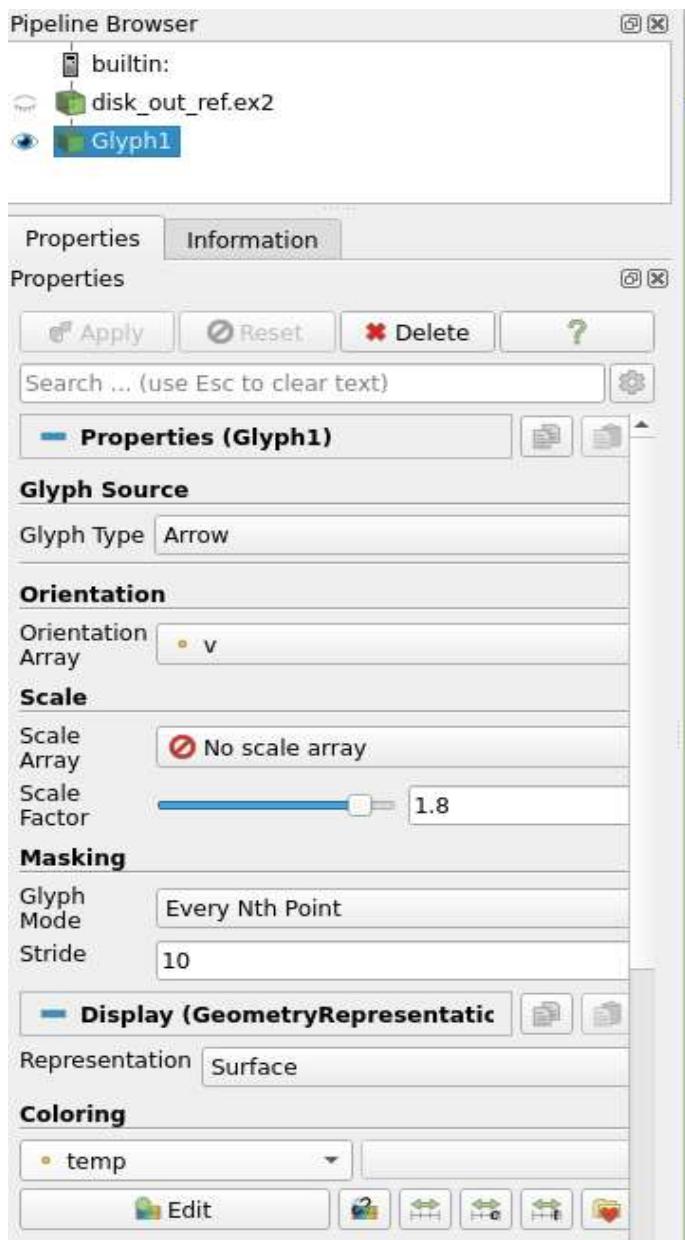

- Extracts a subset of a grid by defining a volume of interest and a sampling rate

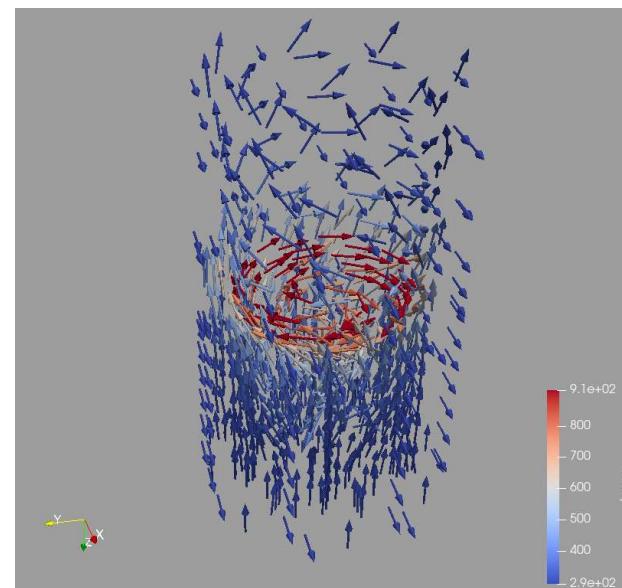

## Exercise 2

- Load  
`/p/scratch/share/zilken1/ParaView_HandsOn/  
disk_out_ref2.ex2`
- Lets have some fun with filters for **vector-data**,  
see next slides

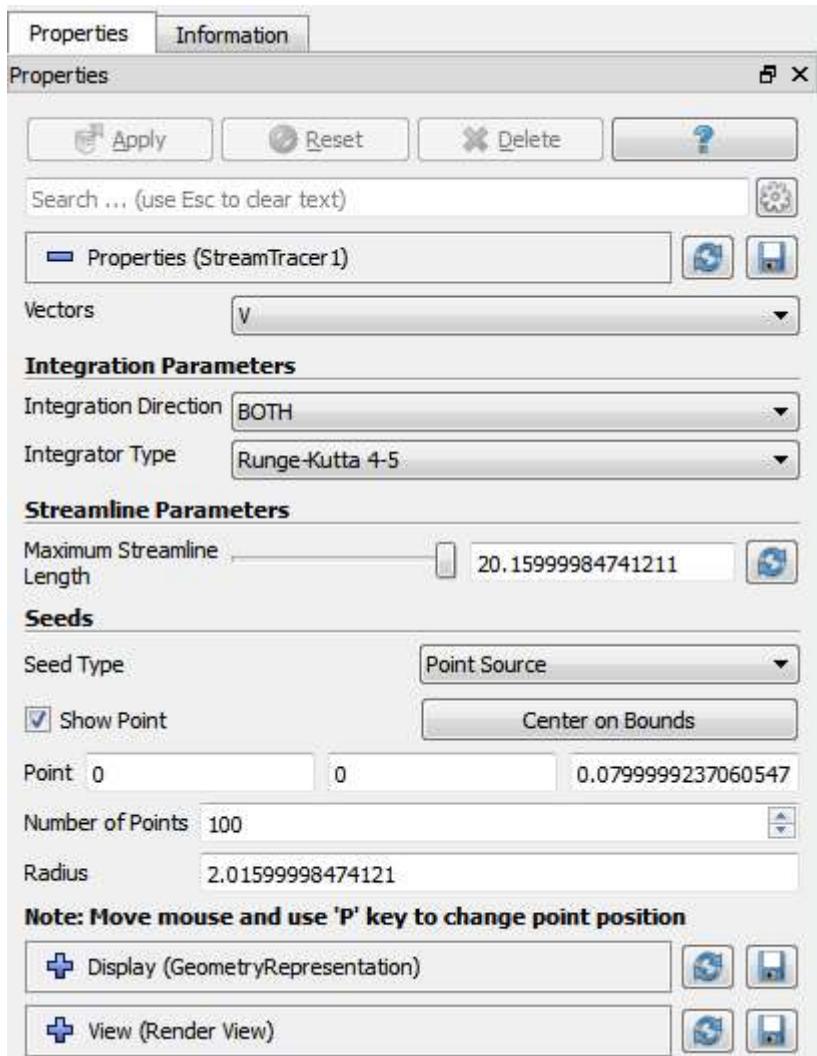

# Common Filters: Glyph

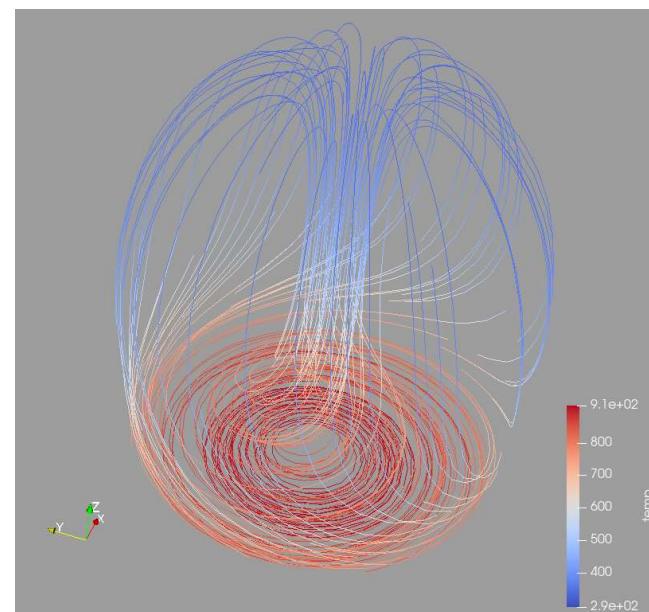

- Places a glyph, a simple shape, on each point (or subset) in a mesh
- glyphs may be oriented by a vector and scaled by a vector or scalar.

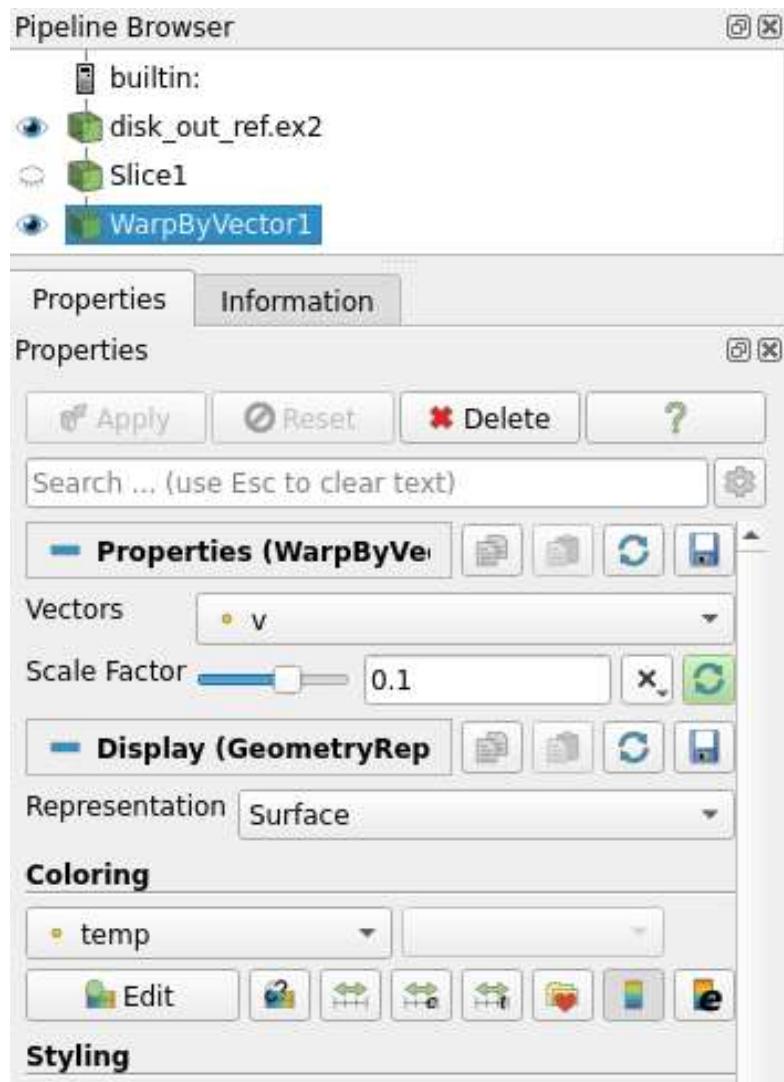

# Common Filters: Stream Tracer

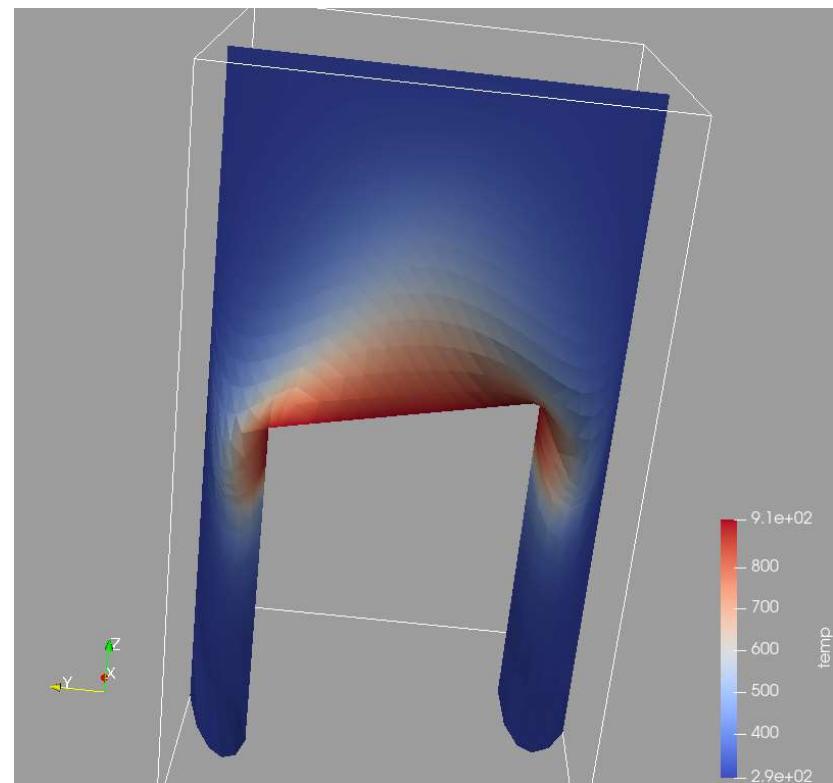

- Seeds a vector field with points and then traces those seed points through the (steady state) vector field.

# Common Filters: Warp (vector)

- Displaces each point in a mesh by a given vector field.

# Calculations within ParaView

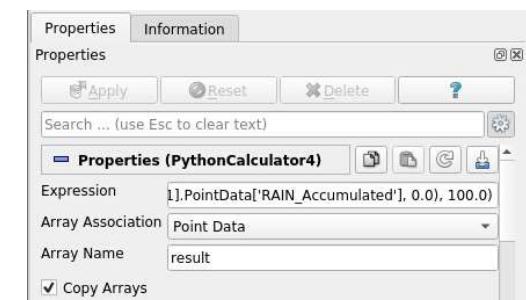

**Calculator:** calculates new attributes based on simple expression

- example: „LANDMASK\*(abs(HGT) + 20.0)“
- Can generate vectors from scalars via „ $i\text{Hat}*\text{velocity\_x} + j\text{Hat}*\text{velocity\_y} + k\text{Hat}*\text{velocity\_z}$ “
- Can generate new coordinates
- Unflexibel, no „if“ statement

**PythonCalculator:** calculates new attributes based on simple Python expression

- NumPy and SciPy functions can be used
- Can generate vectors from scalars via „`make_vector (velocity_x , velocity_y , velocity_z)`“
- No „if“ statement, but `numpy.where` works, e.g.  
„`numpy.where(Rain > 20, -1 * Rain, LANDMASK*(numpy.abs(HGT)+20))`“

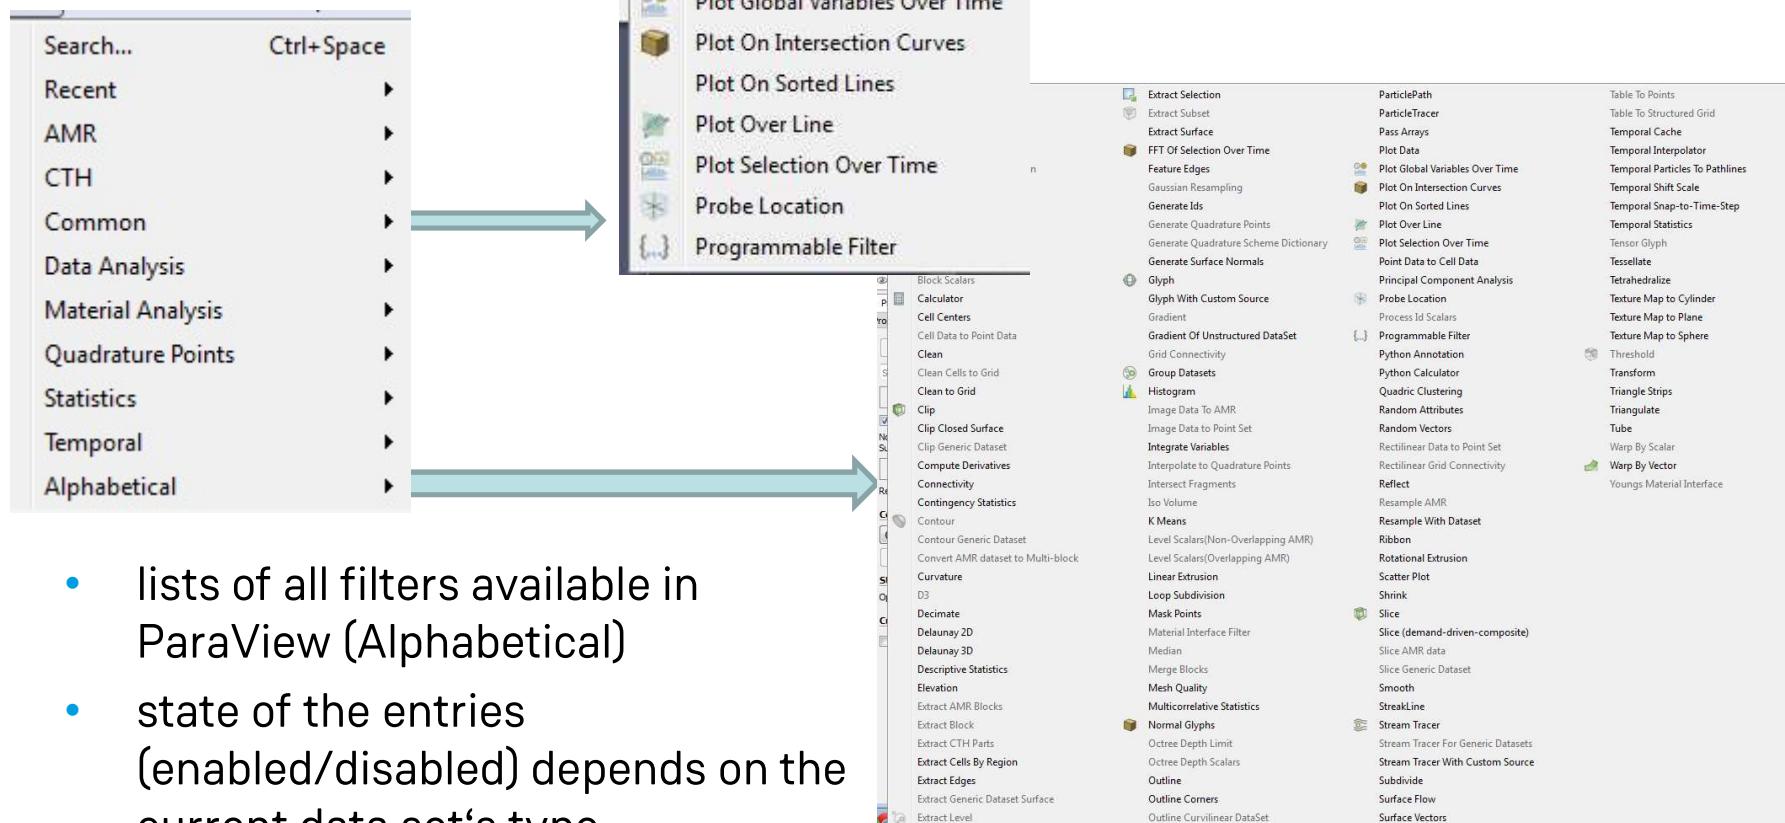

## Programmable Source/Filter

- Most flexible
- Needs some deeper knowledge of ParaView conventions and data flow

# Filter Menu:

Many more filters in the Filters Menu

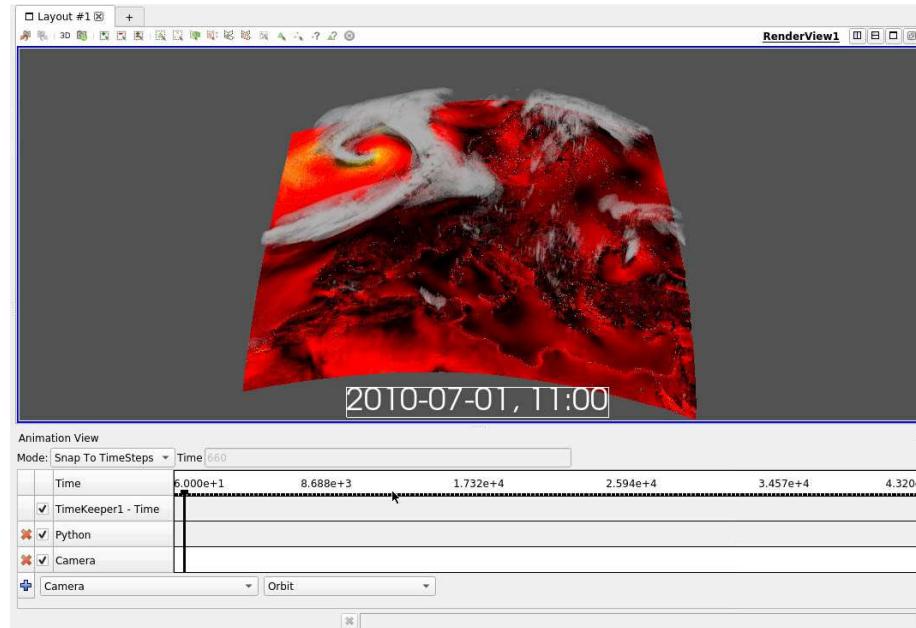

- lists of all filters available in ParaView (Alphabetical)
- state of the entries (enabled/disabled) depends on the current data set's type
- See [Page 25](https://www.paraview.org/Wiki/ParaView/Users_Guide>List_of_filters</a></li>
</ul>
</div>
<div data-bbox=)

# Animating Data

Using the Animation View, ParaView can animate

- Data time steps (if you have time-dependent data)
- Nearly any property of any pipeline object
- The camera, to perform camera flights along a specified path or orbit.
- Use Python scripts to manipulate the scene every time step

## Exercise 3

- Load  
`/p/scratch/share/zilken1/ParaView_HandsOn/  
can.ex2`
- Lets have some fun with **animations**

# Parallel ParaView

# Parallel ParaView

## Start EGL version of ParaView Server (pvserver)

Load modules

```
ml Stages/2022  GCC/11.2.0  ParaStationMPI/5.5.0-1
ml ParaView/5.10.1-EGL
```

Start a job with pvserver, e.g.

```
srun --account=<YOUR_BUDGET> --nodes=<NUM_NODES> --
partition=<PARTITION> --ntasks-per-node=<TASK_PER_NODE>
pvserver
```

Wait for the job to start and look at the nodename in the output:

```
[zilken1@jwvis03 bin]$ srun --account=cstvs --nodes=2 --partition=batch --ntasks
-per-node=1 pvserver
srun: job 6336998 queued and waiting for resources
srun: job 6336998 has been allocated resources
Waiting for client...
Connection URL: cs://jwc02n256.juwels:11111
Accepting connection(s): jwc02n256.juwels:11111
[
```

# Parallel ParaView

## Start ParaView GUI and edit Server Configuration

Load modules and start ParaView GUI

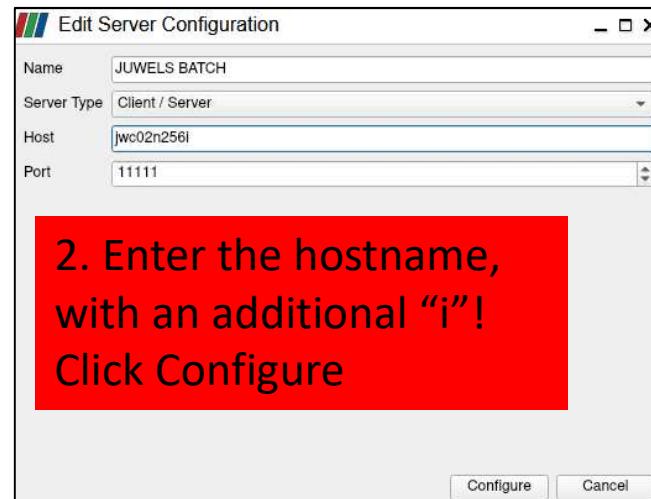

```
ml Stages/2022  GCC/11.2.0  ParaStationMPI/5.5.0-1
```

```
ml ParaView/5.10.1
```

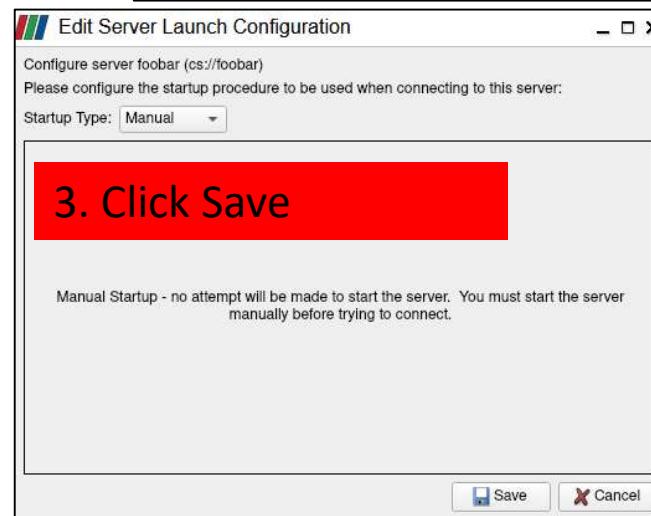

```
vglrun paraview
```

In the Menue, select File -> Connect, then

1. Click Add Server

2. Enter the hostname,  
with an additional “i”!  
Click Configure

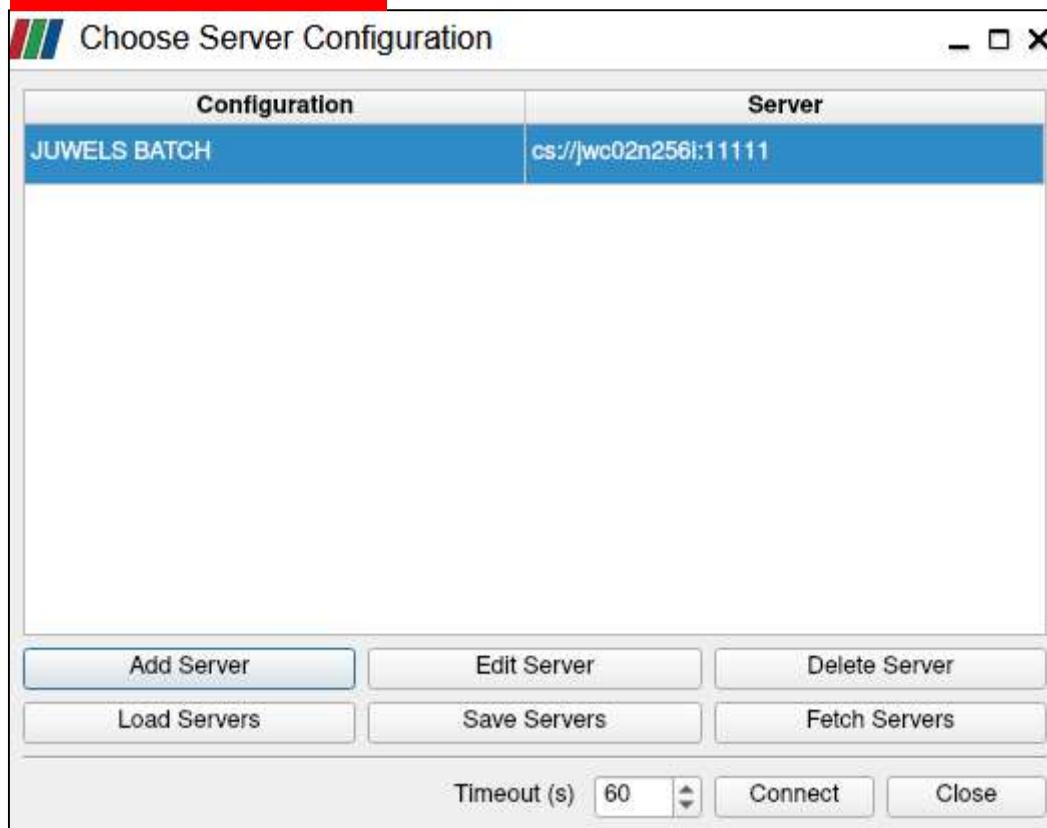

3. Click Save

# Parallel ParaView

Connect GUI to pvserver

4. Click Connect

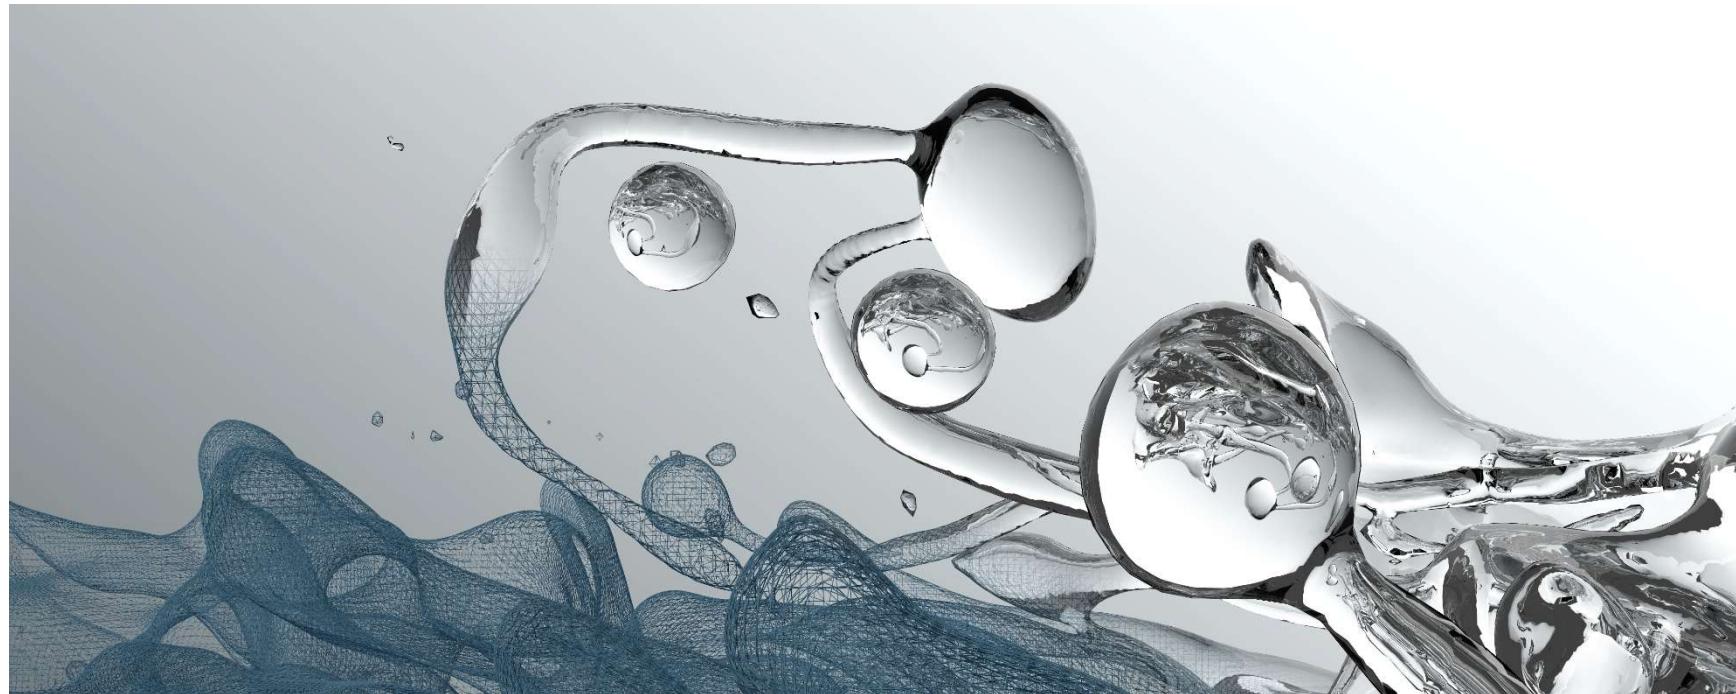

5. Check if connection is established

```
Waiting for client...
Connection URL: cs://jwc02n256.juwels:11111
Accepting connection(s): jwc02n256.juwels:11111
Client connected.
```

# Thank you for your attention

## Questions ... ?

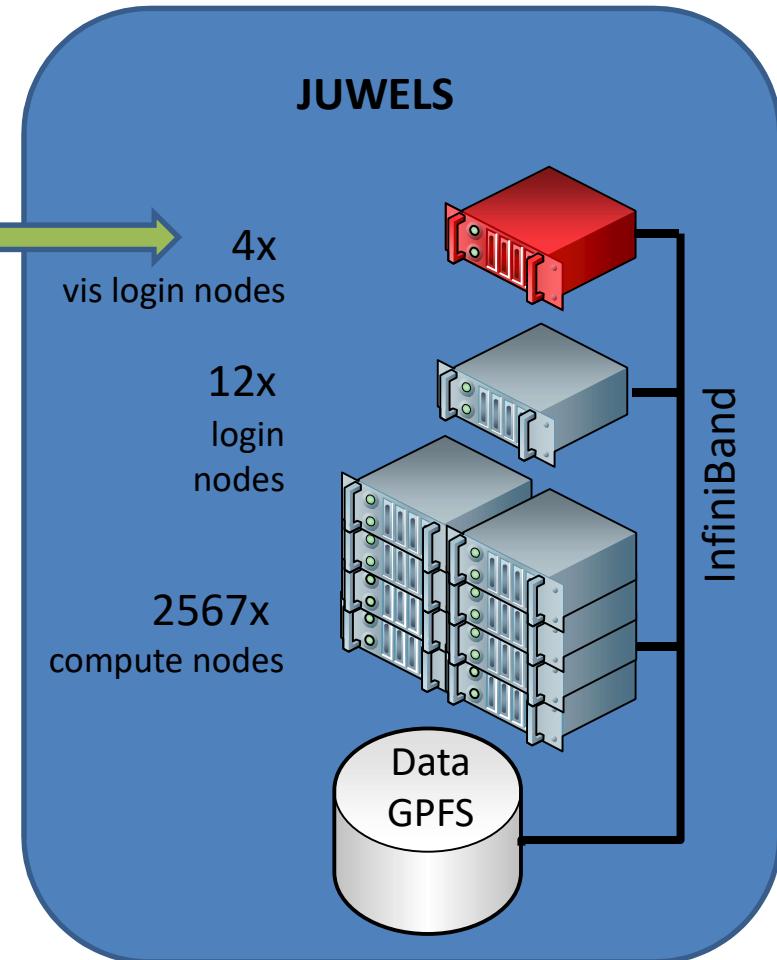

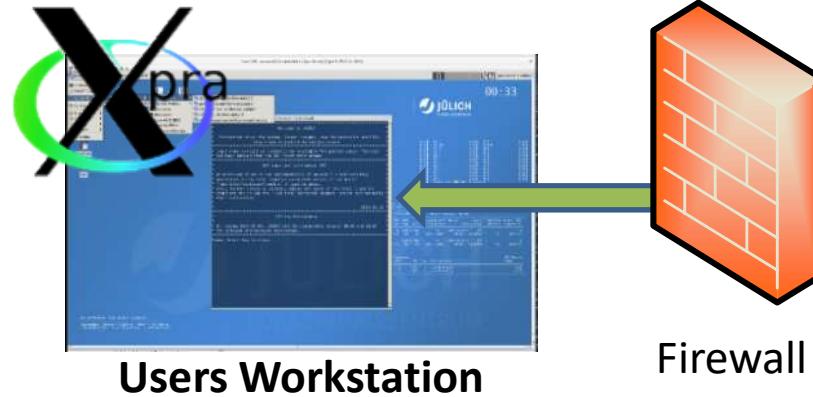

rendered with Blender from a DNS of a diesel injection spray of ITV, RWTH Aachen University

# Appendix: How to start Xpra manually

# Manual Setup of Xpra

with Xpra + VirtualGL

## HowTo start an Xpra session manually

1. SSH to HPC system, authenticate via SSH key pair
2. Load modules and start an application via Xpra.  
E.g. start an xterm:  
`xpra start --start=xterm`

Look at the output and note the **display number**,  
e.g. „Actual display used: :3“

3. start local Xpra client and connect to remote display
4. Start visualization application in the xterm
5. Stop the Xpra session by `xpra stop :3`

# Manual Setup of Xpra

Step 1: store your private ssh key in a key manager

- Windows: use pageant from the PuTTY
- Linux: start ssg-agent (if not already running)  
ssh-add your private key

Step 2: login to a (visualization) login node

- **Linux:**  
`ssh <USERID>@juwelsvis02.fz-juelich.de`
- **Windows:**  
connect via a ssh client, e.g. PuTTY

# Setup Xpra

Step 3: start xpra on HPC node and notice the display-number in the output

For example, start an xterm in Xpra:

```
jwvis02> ml Stages/2022  GCCcore/.11.2.0 xpra/4.3.4
jwvis02> xpra start --start=xterm
...
Actual display used: :3
```

- The display-number is needed to connect to the Xpra session

## Setup Xpra manually

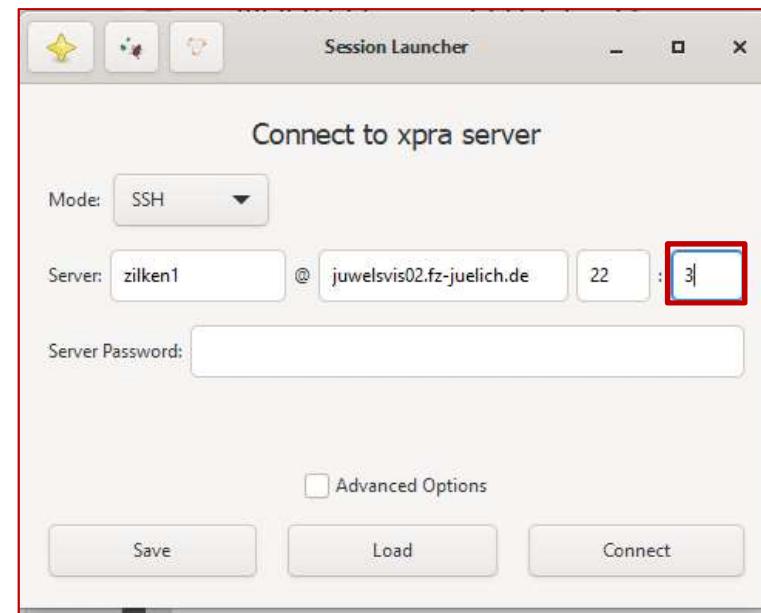

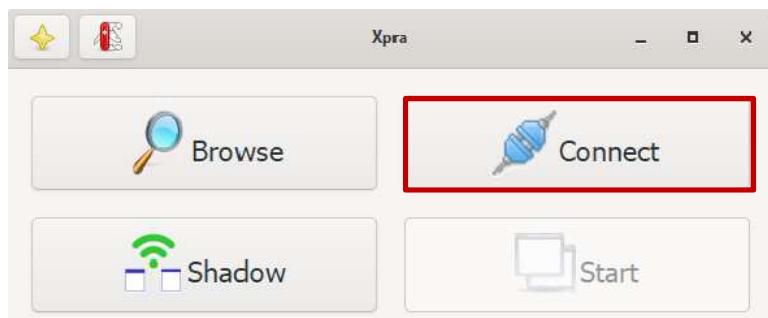

Step 4: connect to Xpra session

Install Xpra on your local machine. Download from  
[www.xpra.org](http://www.xpra.org) (or just use your packagemanager in Linux)

**Linux:** use command (or GUI like Windows)

```
local_machine> xpra attach  
ssh://USERNAME@juwelsvis02.fz-juelich.de:3
```

**Windows:** use Xpra GUI:

## Setup Xpra

### Step 4: start visualization application

After successful connection, an xterm window will show up on your local desktop.

Start your application there, e.g. ParaView 5.10.1:

The screenshot shows a terminal window titled "zilken1@jwvis02:~/bin on juwelsvis02.fz-juelich.de". The window contains the following command history:

```
[zilken1@jwvis02 bin]$ ml Stages/2022 GCC/11.2.0 ParaView/5.10.1
[zilken1@jwvis02 bin]$ vglrun paraview
[zilken1@jwvis02 bin]$ █
```

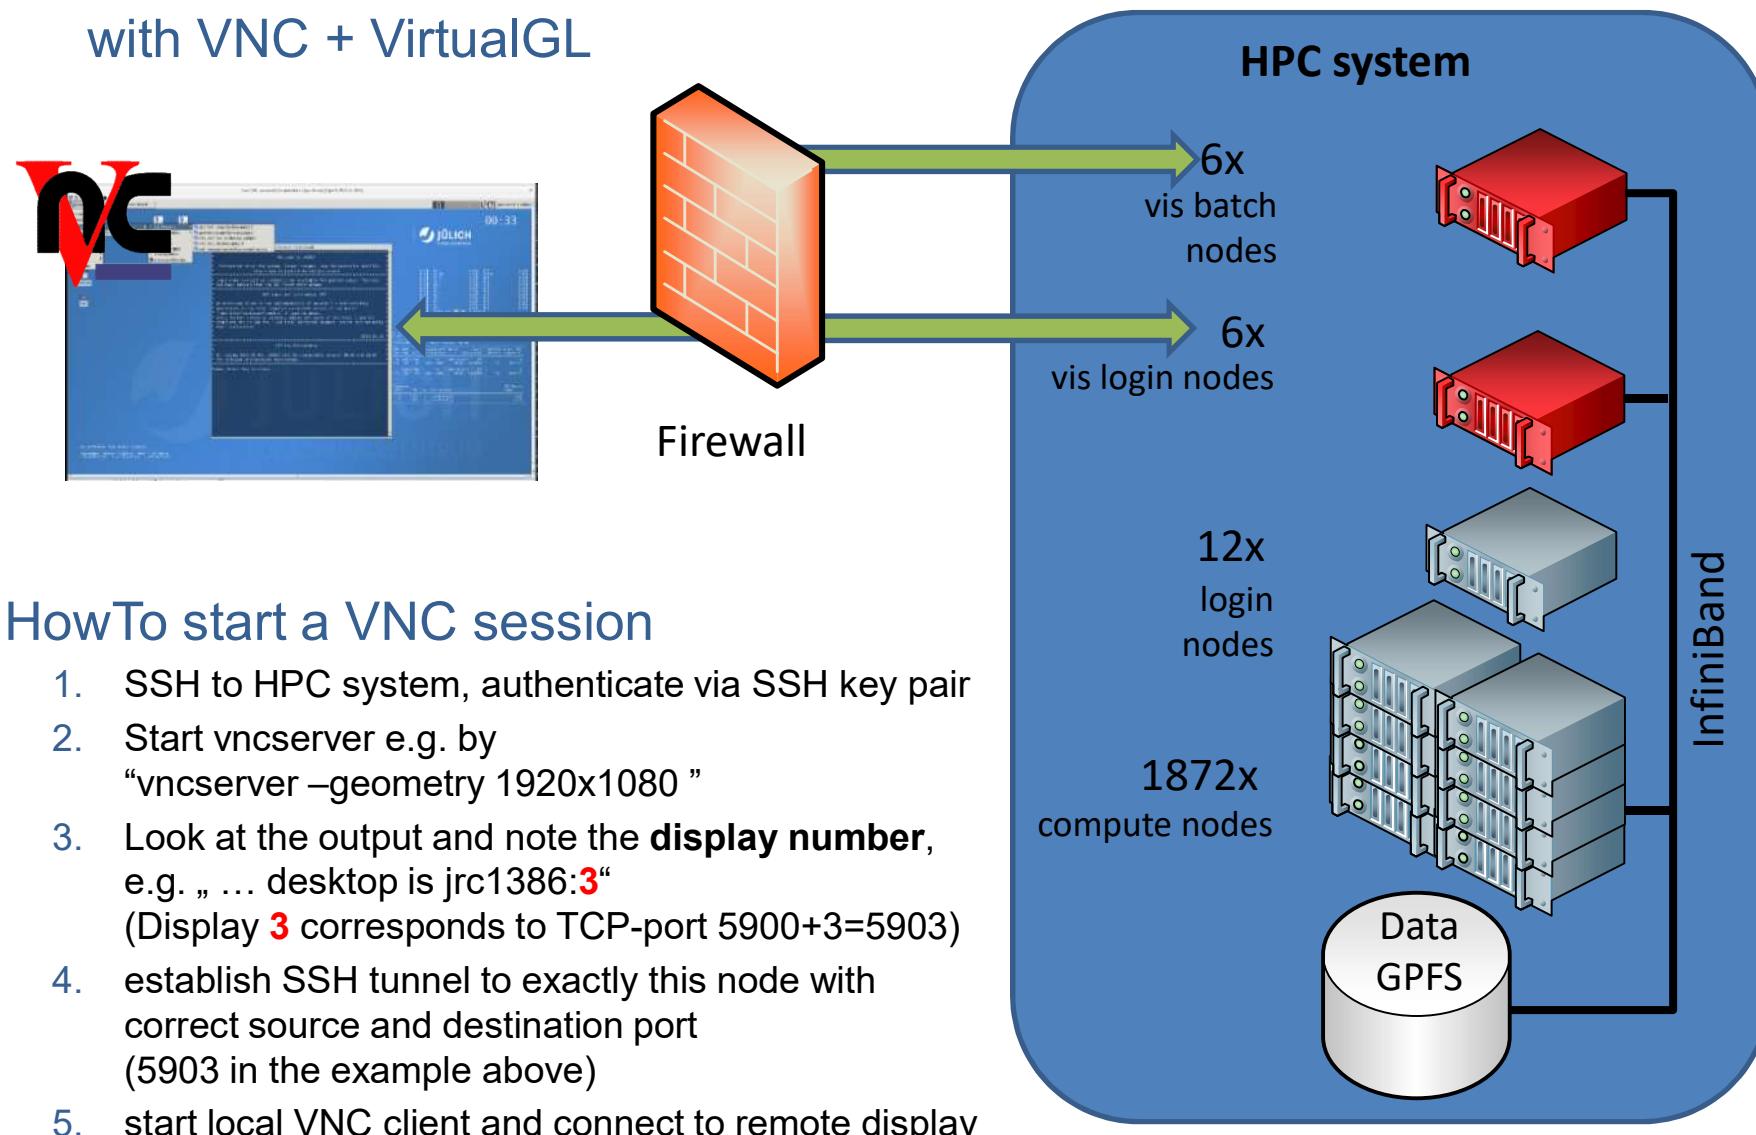

### Step 5: When you are done, stop the session by

jwvis02> xpra stop :3

# Appendix: How to start a VNC session

# Remote 3D Visualization

with VNC + VirtualGL

## HowTo start a VNC session

1. SSH to HPC system, authenticate via SSH key pair
2. Start vncserver e.g. by  
“vncserver –geometry 1920x1080 ”
3. Look at the output and note the **display number**,  
e.g. „... desktop is jrc1386:**3**“  
(Display **3** corresponds to TCP-port 5900+3=5903)
4. establish SSH tunnel to exactly this node with  
correct source and destination port  
(5903 in the example above)
5. start local VNC client and connect to remote display

# Setup VNC Connection

Preliminary step: **setup a VNC Password**  
(need only be done once)

- Login to a JUWELS or JURECA visualization node, create the directory `~/.vnc` and define VNC password
- E.g.:

```
ssh <USERID>@jurecavis.fz-juelich.de
```

```
mkdir ~/.vnc
```

```
vncpasswd
```

# Setup VNC Connection

## Step 1: login to a specific visualization login node

- Hint: to establish a ssh tunnel, you need to connect to the same login node twice! Therefore:  
**Don't use the „generic“ names (juwelsvis, jurecavis).**  
**Instead select a specific node randomly**  
(juwelsvis00 .. juwelsvis03, jureca01 .. Jureca12)
- **Linux:**  
ssh <USERID>@juwelsvis00.fz-juelich.de
- **Windows:**  
connect via a ssh client, e.g. PuTTY. The PuTTY ssh keyagent pageant may be usefull, too.

# Setup VNC Connection

Step 2: start VNC-server on HPC node and locate the display-number in the output

## Example:

```
vncserver -geometry 1920x1080
...
desktop is <node-name>:3
...
```

- The display-number is needed to establish the ssh tunnel (see step 3).  
The VNC-server listens to TCP-port 5900+display-number (**5903** in the example)

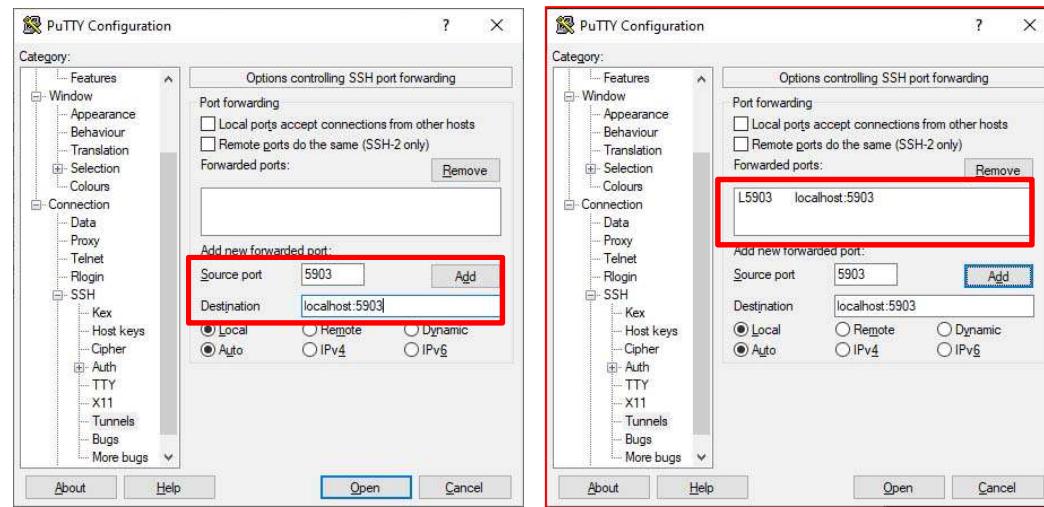

# Setup VNC Connection

## Step 3: establish the ssh tunnel

- Use the correct TCP port! Port must correspond to the display number (**3** in this example)
- **Linux:**

```
ssh -N -L 5903:localhost:5903  
<USERID>@juwelsvis00.fz-juelich.de
```

- **Windows:**  
Use e.g. PuTTY  
to setup the tunnel

# Setup VNC Connection

Step 4: start your local VNC viewer

## Linux:

VNC viewer typically is already part of the Linux distribution or can be installed from a repository. Just start vncviewer with the correct display-number:

vncviewer localhost:**3**

## Windows:

Download and install turboVNC:

<https://sourceforge.net/projects/turbovnc/>

Connect to localhost:**3**
